

Sales Intelligence: Scrape the Market, Find the Right People, Know What to Pitch

Project Overview

The proposed Sales Intelligence solution is a B2B sales intelligence and data enrichment platform designed to help businesses identify potential companies, find the relevant decision-makers within those companies, obtain verified contact information, and determine what products or services to pitch to each prospect.

The system essentially converts **raw market data into sales-ready prospects** by combining web/LinkedIn data scraping, company and employee enrichment, contact verification, and AI-generated sales recommendations.

Problem Being Solved

Traditional B2B prospecting often requires sales teams to manually:

- Identify companies within a target market.
- Research company information.
- Find relevant employees or decision-makers.
- Search for their contact information.
- Determine whether the company is a suitable prospect.
- Research what product or service would be relevant to that company.
- Create an appropriate sales pitch.

This process is time-consuming and can result in outdated or incomplete prospect databases.

The system attempts to automate this process by continuously collecting and enriching market information instead of relying entirely on static contact lists.

How the System Works

The platform follows a four-stage process that transforms a broad target market or raw prospect list into enriched, sales-ready opportunities.

Ingest → Enrich → AI Analysis → Reach Out

1. Ingest — Identify the Target Market

The process begins with defining the companies the sales team wants to target. The platform supports two entry points:

- **CSV Upload:** Import an existing list of companies or prospects, including any available company or contact information.
- **Market Discovery:** Specify a target market or segment and use web and LinkedIn scraping to discover relevant companies and employees.

The output of this stage is a **raw prospect pool** that can be processed and enriched further.

2. Enrich — Build the Prospect Profile

The platform converts basic company records into detailed company and contact profiles.

Company Enrichment captures information such as:

- Firmographic and company information
- Industry and market segment
- Employee information
- Relevant business and market signals

Contact Enrichment identifies relevant people within each organization — such as founders, executives, decision-makers, or functional leaders — and associates them with available email addresses and phone numbers.

A verification layer is applied to contact information to improve its accuracy and usability for outreach.

Output:

A consolidated prospect profile combining Company Intelligence + Relevant Contacts + Verified Contact Information.

3. AI Analysis — Determine What to Pitch

The enriched prospect profile is then analyzed by the AI recommendation layer.

Rather than stopping at “*here is a company and its contact details*,” the system attempts to determine **why the company may be relevant and how it could be approached**.

For each prospect, the AI generates:

Sales Question	AI Output
What to pitch?	Potentially relevant product or service
Why this company?	Business context, signals, or characteristics supporting the opportunity
How to approach?	Suggested sales angle and conversation talking points

This transforms the output from a conventional prospect list into **contextualized sales intelligence** that can help a salesperson prepare for the conversation.

Output:

Prospect + Relevant Contact + Why It Matters + What to Pitch + Talking Points

4. Reach Out — Take the Prospect Into Action

Once the prospect has been enriched and analyzed, the resulting information can be used for outreach through multiple channels:

WhatsApp · Phone · Email

The enriched prospect data and AI-generated recommendations can also be passed into existing **CRM, calling, messaging, or sales automation workflows**, or exported for use in other systems.

This creates a connected flow from **prospect discovery** → **research** → **sales intelligence** → **outreach**, reducing the amount of manual research required before a salesperson can engage with a prospect.

Technical Engine Behind the Workflow

Each stage of the process is backed by a dedicated component, summarized below.

Component	What it does	Sales value
Web / LinkedIn Scraping	Collects fresh company, employee and market information	Keeps prospect data current
Data Enrichment Pipeline	Builds detailed company + employee profiles	Gives sales teams more context before outreach
Contact Verification	Verifies relevant emails and phone numbers	Improves contactability and reduces wasted outreach
AI Recommendation Layer	Analyzes the prospect and generates pitch angles	Helps salespeople understand what to say and why
Data Processing Pipeline	Handles CSV ingestion, deduplication, enrichment and export	Makes large-scale prospecting operationally manageable
Multi-Channel Integration	Pushes prospects into WhatsApp, calling and email workflows	Converts research directly into outreach
Credit-Based Usage Model	Tracks enrichment activity through credits	Enables usage-based monetization instead of traditional per-seat pricing

Architecture

Business Value

The main business value is reducing the manual effort involved in B2B prospecting and improving the quality of sales outreach.

Instead of spending significant time researching prospects, sales teams can receive:

**Company → Relevant Person → Verified Contact → Potential Sales
Opportunity → Suggested Pitch**

This can help businesses:

- Discover new prospects faster.
- Maintain fresher market data.
- Reduce manual prospect research.
- Identify relevant decision-makers.
- Personalize initial outreach.
- Increase the efficiency of sales teams.
- Integrate enriched prospects directly into downstream sales workflows.
